

# Simply In Control

Simply In Control

Meet Verve, the easy-to-use, whole-house system that helps you customize and control lighting, temperature, and energy use. It's the revolutionary new way to go wireless.

It's almost as if your home knows what you're thinking.

Home has simply never felt better. Comfortable. Efficient. Adapting itself to the way you live. With the Verve system, a click of a wireless switch adjusts the ambience for the mood of the moment. And the system's seemingly endless flexibility and simple operation make it easy to keep your home in tune with your lifestyle.

Your needs and preferences – not to mention your décor – can go through a lot of changes during the years you live in your home. With the Verve system, your home easily stays in step with the changes, giving you greater enjoyment through the years.

The Verve system makes your home  
more comfortable, more flexible,  
more a true extension of you.

The Verve system creates a comfortable relationship between home and homeowner.

Imagine clicking a switch on your bedside table for a soft pathway of light down the hall to the baby's room, or switching the family room instantly from bright light for reading to a subdued glow for watching movies.

Say you're preparing a meal for guests with lights full and bright as you work. The moment the doorbell rings, one click of a Verve switch changes the lighting to a more dramatic scene for entertaining.

Going to be out for the day? Simply let your home know. Click a single switch as you leave to turn off lights, set the air conditioning to economy mode, and switch off power to outlets connected to energy-draining devices such as TVs.

As you return in the evening, tell your home you've arrived. Switches work up to 300 feet from a controller, so you can even carry one in your car. Just click as you pull into the driveway. Lights and electrical outlets switch on, and the temperature resets to the comfort level you prefer.

There's another way the Verve system makes you feel really comfortable, and that's when you open your monthly utility bill. The system makes cutting your energy use practically effortless.

Saving energy comes naturally with Verve.

Think of the devices – TVs, stereo systems, game consoles, computers – steadily draining power in standby mode. Turning them off individually is a hassle. With the Verve system, one click when leaving home can, if you choose, switch them all off, along with turning off lights and setting the thermostat to energy-saving economy mode.

Dimming lights to create scenes and lighting pathways can save a surprising amount of energy. You'll even notice that your light bulbs last longer.

For still more energy-saving potential, the Verve system offers a vacancy sensor that will automatically switch off lights if a room is unoccupied for a period of time you set.

Streamlined, intuitive, flexible.  
Who could have imagined that  
a whole-house control system  
would be so easy to use?

## Get to know Verve™ Living Systems.

### 10-Channel Controller

Each Verve controller commands up to 10 combinations of lights, ceiling fans, and switched receptacles. It takes just moments to program or, when you're ready for a change, to reprogram.

### Switches

Choose any combination of single, double, and mini switches to control your Verve system. Switches work without wires or batteries. Every switch is also a dimmer.

### Thermostat

In addition to manual operation, the thermostat can activate a whole-house economy mode or comfort mode with one click of a wireless switch.

### Vacancy Sensor

If a room is unoccupied for a specified period of time, the Verve occupancy sensor automatically shuts off lights to reduce your energy use.

Like most great solutions, it's elegantly simple.

Instead of being wired to the lights, ceiling fans, and other devices they control, Verve switches and sensors communicate with a central controller through an innovation called EnOcean technology.

This brilliantly simple technology harvests tiny amounts of energy to send a radio signal to the controller. Verve switches use the kinetic energy generated by clicking the switch; Verve sensors harvest the energy of light, much like a solar cell. No batteries needed.

Wireless lighting control makes your home more environmentally friendly by using less materials in construction. And the system's simplicity helps make it affordable.

## Make your new home a Verve home.
